

User testing findings and usability issues found during onboarding testing

Testing Summary

While trying to register a new service provider on the platform, I ran into a few issues that make the sign-up process frustrating or incomplete. Below are the main things I noticed that need fixing before real users start using the system.

NEEDS URGENT FIX

POST https://system.dezhubconnect.com/hr/employee.php?id=3 net::ERR_HTTP_RESPONSE_CODE_FAILURE
500 (Internal Server Error)

What this means for the user: Users cannot complete their profile or upload required documents like ID or certificates, so registration gets stuck halfway.

LAYOUT ISSUE

What this means for the user: The dropdown covers other input fields like Email and Phone number, making the page look broken and awkward to navigate.

Additional Testing Findings & User Suggestions

3. SMS Verification Codes Are Not Arriving

FEATURE MISSING

During the online registration flow, the system seems to expect SMS verification, but no text messages or code notifications are sent out.

User experience impact: People trying to register online won't receive confirmation codes to verify their phone numbers.

4. Preferred Start Date Allows Past Dates

VALIDATION FLAW

When creating a profile, the field for "Preferred Start Date" lets users pick dates from the past (like setting a start date last month or last year).

User experience impact: This can lead to confusing records where someone's start date is logged as a day that has already passed.

5. Next of Kin & ID Fields Allow Unusually Long Text

INPUT CLEANING

In the registration section for Next of Kin and passport/national ID numbers, you can type random strings of 20+ numbers and letters without any restriction.

User experience impact: Most national IDs or passport numbers have standard lengths. Letting users type endless random text leads to messy profile records.

Suggestions to Improve the Experience for Production

- **Smooth Document Uploads:** When uploading photos or files, add a visible progress bar or clear message if a file is too big (e.g., "File must be under 5 MB"), rather than throwing a blank error page.
- **Fix Screen Alignment:** Ensure all dropdown menus and forms stay nicely fit inside the screen window on both computers and mobile screens.
- **Simple Form Restrictions:** Block the calendar from picking past dates for future start dates, and limit ID text boxes so people can't accidentally paste super long text.
- **Clear Error Messages:** If something goes wrong during registration, give the user a clear hint on what to do next instead of failing silently.

Summary: The registration flow is almost there, but fixing the document upload crash and screening out bad inputs will make the system feel much more reliable and ready for real users.
