

Service Provider Registration Audit

Technical evaluation, server log analysis, and UI/UX defect investigation

TARGET SYSTEM	DOMAIN	AUDITED MODULE	AUDIT DATE
Dezhub ERP System	system.dezhubconnect.com	/hr/employee.php	October 6, 2026

EXECUTIVE SUMMARY

A comprehensive technical audit was executed on the Service Provider Registration onboarding workflow within the Dezhub ERP & Payroll Management platform. The investigation identified **5 primary defects** ranging from critical server failures to interface rendering defects and missing input validation rules. Resolving these items is mandatory prior to production release to prevent data corruption and user drop-off.

1 Critical (P1)	3 Medium (P2/P3)	1 Low (P4)	5 Total Audit Items
--------------------	---------------------	---------------	------------------------

1. HTTP 500 Internal Server Error (Media Upload Crash)

CRITICAL • P1

During service provider onboarding, initial registration completes, but uploading profile images or CV credentials triggers an unhandled backend exception on HTTP POST submission.

```
POST https://system.dezhubconnect.com/hr/employee.php?id=3 net::ERR_HTTP_RESPONSE_CODE_FAILURE 500 (Internal Server Error)
```

Root Cause Analysis: Indicates a fatal PHP execution crash during file handling. Likely causes include write permission restrictions on file upload target folders, missing multi-part form parsing, or exceeding upload_max_filesize in server config.

2. Interface Layout Overflow & Viewport Bounds Defect

MEDIUM • P2

Form controls (notably the **Choose county** selector) expand outside container boundaries and break viewport styling limits.

Observed Impact: The dropdown list detachment forces horizontal scrolling, obscures adjacent form fields (Other phone, Email), and disrupts mobile/tablet responsiveness.

Detailed Findings & Functional Audit (Continued)

3. Unintegrated SMS Gateway in Verification Workflow

MEDIUM • P2

Description: The online service provider registration workflow mandates SMS identity verification and status notifications; however, the backend gateway endpoint remains unconfigured/unintegrated.

Impact: Registration attempts stall without automated PIN verification, stranding new applicants in an unverified state.

4. Missing Business Logic on Preferred Start Date

MEDIUM • P3

Description: The *Preferred Start Date* input control in profile setup lacks date constraint rules, permitting users to pick dates in the past.

Impact: Injects inconsistent scheduling records into ERP reporting modules and violates basic business workflow validation.

5. Inadequate Input Length & Character Validation

LOW • P4

Description: Identification and Next of Kin fields accept arbitrary alpha-numeric strings exceeding 20+ characters without format sanitization.

Impact: Exposes the backend database to dirty data entry and potential storage/rendering anomalies in official generated contracts.

REMEDIATION PLAN & TARGET MATRIX

Item / Issue	Severity	Recommended Action	Target Owner
1. Media Upload HTTP 500	CRITICAL	Audit /hr/employee.php logs, verify upload folder permissions & php.ini size limits.	Backend Developer
2. UI Viewport Overflow	MEDIUM	Apply max-width: 100%, relative container bounds, and z-index rules on select boxes.	Frontend Developer
3. SMS Gateway Integration	MEDIUM	Connect SMS API (Africa's Talking / Twilio) and implement dispatch exception handlers.	Full-Stack Developer
4. Past Date Constraint	MEDIUM	Enforce frontend HTML5 date min attribute and server-side validation (\$Date ≥ Today).	Frontend Developer
5. Field Validation Rules	LOW	Apply Regex patterns and length limits (maxlength="15") on ID/Passport inputs.	Full-Stack Developer
